/dev_stage="4-5 month"
//dab_host="DH10B (phage-resistant)"
/clone_lib="Gong zebrafish ovary"
/clone_lib="Gong zebrafish ovary"
/note="Organ: ovary (pooled); Vector: pBluescript SK-;
Site_1: XhoI; Site_2: EcoRI; Poly A+ RNA was isolatd from
the ovaries of 2 female adult zebrafish (4-5 month old).
cDNAs were made using oligo-dr primers and inserted into
lambda ZAP II vector (Stratagene) by Dr. 2. Gong, in vivo
mass-excised to pBluescript SK- following the Washington
University protocol
                                                                                                                                                                                                                                                                                                                                                      fu84c01.y1 Gong zebrafish ovary Danio rerio cDNA clone

The tissue source for this library is xylem. The xylem
tissue was harvested in spring and summer from branches
of seed orchard trees which are clones of the same
genotype. Branches were 4.6 inches in diameter. The cDNAs
were directionally cloned into Lambda Zap and were
rescued as a Bluescript derivative in the EcoRI and XhoI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

```
polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agazose gel electrophoresis. Vector DNA was prepared from a derivative of pWN42 (gil4/32114|gp[AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Location/Qualifiers

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INVENTATION:

GENERAL INVENTATION: David G.

TITLE OF INVENTION: David G.

TITLE OF INVENTION: Delincification and Mapping of Single Nucleotide

TITLE OF INVENTION: Polymorphisms in the Human Genome

FILE REFERENCE: 10887.129

CURRENT APPLICATION NUMBER: US/10/027,632

CURRENT PILING DATE: 2000-04-30

PRIOR APPLICATION NUMBER: US 60/198,676

PRIOR APPLICATION NUMBER: US 60/193,483

PRIOR APPLICATION NUMBER: US 60/193,483

PRIOR APPLICATION NUMBER: US 60/193,483

PRIOR APPLICATION NUMBER: US 60/167,353

PRIOR FILING DATE: 1999-11-23

PRIOR FILING DATE: 1999-11-23

PRIOR FILING DATE: 1999-09-28

PRIOR FILING DATE: 1999-09-28

PRIOR FILING DATE: 1999-09-28

PRIOR FILING DATE: 1999-09-09

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. SUMMARIES

Submitted (23-FEB-2001) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St. Louis,
MO 63108, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalla; Britheria; Primates; Catarrhini; Hominidae; Homo. 1 (bases 1 to 123778)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                             The invention relates to a nucleic acid molecule comprising at least one base variation from human cytochrome P450 (CVF) 344 or CVP3A5 sequence.

Nucleic acid molecules of the invention are useful for identifying polymorphisms associated with CYP3A4, CYP3A5 or glutathione S-transferase (GST) MI substrates which influence breast cancer treatments. They are also useful in diagnostic purposes to identify individuals having a polymorphic genotype which influence the outcome of breast cancer. The polymorphisms detected are used to streat cancer. The polymorphisms detected are used to streat cancer and the selection of chemotherapeutic agents used to treat cancer. The polymorphisms detected are used to stread metabolism of CYP3A4, CYP3A5 or GSTMI substrates, potential drug-drug interactions, drug adverse effects, likelihood of successful clinical cutome following treatment with anti-cancer agents such as cisplatin, cyclophosphanide and/or BCNU. The present sequence is human CYP3A5
                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; CYP3A5; polymorphism; cancer; cardiovascular disease; diabetes;

The present invention relates to a new CYP3A5 polynucleotide encoding a polypeptide, where the polynucleotide is capable of hybridising to a CYP3A5 gene. The invention is useful in an in vitro method for identifying a polymorphism. The invention is also useful for useful for identifying a polymorphism. The invention is also useful for useful for diagnosing a disorder related to the presence of a molecular variant of cripax5 or susceptibility to such a disorder, where the disorder is cancer, or diseases including cardiovascular diseases, diabetes and AIDS. The invention can further be used for the preparation of a diagnostic composition for diagnosing a disease in a subject having a genome composition for diagnosing a disease in a subject having a genome composition are included of the CYP3A5 gene, where the subject is an African American. The molecules of the invention are as forensic markers and in pharmacological studies. The present nucleic acid sequence represents a genomic DNA sequence that contains a region in which a polymorphism of the human CYP3A5 gene was detected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; transgenic; drug metabolism; behaviour; gene; mouse; pharmacokinetic assay; pharmacodynamic assay; toxicology; serum albumin; alpha-acidic glycoprotein; CTP; multidrug resistance protein; MRP; uridine diphosphoglucuronosyl transferase; UGT; cytochrome P450.
                                 Novel CYP3A5 polynuclectide useful for diagnosis and treatment of cancer, cardiovascular diseases, diabetes and AIDS, and for identifying polymorphisms
